
2-Port USB 2.0 Hub Controller

Highlights

- Integrated USB 2.0 Compatible 2-Port Hub
 - High-Speed (480Mbps/s), Full-Speed (12Mbps/s) and Low-Speed (1.5Mbps/s) compatible
 - Full power management with ganged power control
 - Detects Bus-Power/Self-Power source and changes mode automatically
- Complete USB Specification 2.0 Compatibility
 - Includes USB 2.0 Transceivers
- VID/PID/DID, and Port Configuration for Hub via:
 - Single Serial I²C EEPROM
 - SMBus Slave Port
- Default VID/PID/DID, allows functionality when configuration EEPROM is absent
- Hardware Strapping options allow for configuration without an external EEPROM or SMBus Host
- On-Board 24MHz Crystal Driver Circuit or 24 MHz external clock driver
- Internal PLL for 480MHz USB 2.0 Sampling
- Internal 1.8V Linear Voltage Regulator
- Integrated USB termination and Pull-up/Pull-down resistors
- Internal Short Circuit protection of USB differential signal pins
- Basic single-color LED support
- 1.8 Volt Low Power Core Operation
- 3.3 Volt I/O with 5V Input Tolerance
- 36-Pin QFN or 48-Pin TQFP RoHS compliant package

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

Customer Notification System

Register on our web site at www.microchip.com to receive the most current information on all of our products.

USB2502

1.0 INTRODUCTION

The Microchip 2-Port Hub is fully compliant with the USB 2.0 Specification and will attach to a USB host as a Full-Speed Hub or as a Full-/High-Speed Hub. The 2-Port Hub supports Low-Speed, Full-Speed, and High-Speed (if operating as a High-Speed Hub) downstream devices on all of the enabled downstream ports.

The Hub works with an external USB power distribution switch device to control V_{BUS} switching to downstream ports, and to limit current and sense over-current conditions.

All required resistors on the USB ports are integrated into the Hub. This includes all series termination resistors on D+ and D- pins and all required pull-down and pull-up resistors on D+ and D- pins. The over-current sense inputs for the downstream facing ports have internal pull-up resistors.

Throughout this document the upstream facing port of the hub will be referred to as the upstream port, and the downstream facing ports will be called the downstream ports.

1.1 OEM Selectable Features

A default configuration is available in the USB2502 following a reset. This configuration may be sufficient for some applications. Strapping option pins make it possible to modify a limited sub-set of the configuration options.

The USB2502 may also be configured by an external EEPROM or a microcontroller. When using the microcontroller interface, the Hub appears as an SMBus slave device. If the Hub is pin-strapped for external EEPROM configuration but no external EEPROM is present, then a value of '0' will be written to all configuration data bit fields (the hub will attach to the host with all '0' values).

The 2-Port Hub supports several OEM selectable features:

- Operation as a Self-Powered USB Hub or as a Bus-Powered USB Hub.
- Operation as a Dynamic-Powered Hub (Hub operates as a Bus-Powered device if a local power source is not available and switches to Self-Powered operation when a local power source is available).
- Optional OEM configuration via I²C EEPROM or via the industry standard SMBus interface from an external SMBus Host.
- Compound device support (port is permanently hardwired to a downstream USB peripheral device).
- Hardware strapping options enable configuration of the following features.
 - Non-Removable Ports
 - Port Power Polarity (active high or active low logic)

FIGURE 4-1: 2-PORT BLOCK DIAGRAM

TABLE 4-1: 2-PORT HUB PIN DESCRIPTIONS

Name	Symbol	Type	Function
UPSTREAM USB 2.0 INTERFACE			
USB Bus Data	USBDN0 USBDP0	IO-U	These pins connect to the upstream USB bus data signals.
Detect Upstream VBUS Power	VBUS_DET	I/O8	<p>Detects state of Upstream VBUS power. The Microchip Hub monitors VBUS_DET to determine when to assert the internal D+ pull-up resistor (signaling a connect event).</p> <p>When designing a detachable hub, this pin must be connected to the VBUS power pin of the USB port that is upstream of the hub. (Use of a weak pull-down resistor is recommended.)</p> <p>For self-powered applications with a permanently attached host, this pin must be pulled-up to either 3.3V or 5.0V (typically VDD33).</p>

TABLE 4-1: 2-PORT HUB PIN DESCRIPTIONS (CONTINUED)

Name	Symbol	Type	Function
2-PORT USB 2.0 HUB INTERFACE			
High-Speed USB Data	USBDN[2:1] USBDP[2:1]	IO-U	These pins connect to the downstream USB peripheral devices attached to the Hub's ports.
USB Power Enable	P RTPWR	O8	Enables power to USB peripheral devices (downstream). The active signal level of the P RTPWR pin is determined by the Power Polarity Strapping function of the P RTPWR_POL pin.
Port [2:1] Green LED & Port Non-Removable strapping option.	GR[2:1]/ NON_REM[1:0]	I/O8	Green indicator LED for ports 2 and 1. Will be active low when LED support is enabled via EEPROM or SMBus. If the hub is configured by the internal default configuration, these pins will be sampled at the rising edge of RESET_N (see the applicable RESET_N timing table in Section 5.6.1) to determine if ports [2:1] contain permanently attached (non-removable) devices. Also, the active state of the LED's will be determined as follows: NON_REM[1:0] = '00', All ports are removable, GR2 is active high, GR1 is active high. NON_REM[1:0] = '01', Port 1 is non-removable, GR2 is active high, GR1 is active low. NON_REM[1:0] = '10', Ports 1 & 2 are non-removable, GR2 is active low, GR1 is active high. NON_REM[1:0] = '11', Ports 1 & 2 are non-removable, GR2 is active low, GR1 is active low.
Port Power Polarity strapping.	P RTPWR_POL	I/O8	Port Power Polarity strapping determination for the active signal polarity of the P RTPWR pin. While RESET_N is asserted, the logic state of this pin will (though the use of internal combinatorial logic) determine the active state of the P RTPWR pin in order to ensure that downstream port power is not inadvertently enabled to inactive ports during a hardware reset. On the rising edge of RESET_N (see the applicable RESET_N timing table in Section 5.6.1), the logic value will be latched internally, and will retain the active signal polarity for the P RTPWR pin. '1' = P RTPWR pin has an active 'high' polarity '0' = P RTPWR pin has an active 'low' polarity
Over Current Sense	OCS_N	IPU	Input from external current monitor indicating an over-current condition. {Note: Contains internal pull-up to 3.3V supply}
USB Transceiver Bias	RBIAS	I-R	A 12.0kΩ (+/- 1%) resistor is attached from ground to this pin to set the transceiver's internal bias settings.

USB2502

TABLE 4-1: 2-PORT HUB PIN DESCRIPTIONS (CONTINUED)

Name	Symbol	Type	Function
SERIAL PORT INTERFACE			
Serial Data/SMB Data	SDA/SMBDATA	IOSD12	(Serial Data)/(SMB Data) signal.
Serial Clock/SMB Clock & Config Select 0	SCL/SMBCLK/CFG_SEL0	IOSD12	(Serial Clock)/(SMB Clock) signal. This multifunction pin is read on the rising edge of RESET_N (see the applicable RESET_N timing table in Section 5.6.1) and will determine the hub configuration method as described in Table 4-2 .
Configuration Programming Select	CFG_SEL1	I	This pin is read on the rising edge of RESET_N (see the applicable RESET_N timing table in Section 5.6.1) and will determine the hub configuration method as described in Table 4-2 .

TABLE 4-2: SMBUS OR EEPROM INTERFACE BEHAVIOR

	CFG_SEL1	CFG_SEL0	SMBus or EEPROM Interface Behavior
	0	0	Reserved
	0	1	Configured as an SMBus slave for external download of user-defined descriptors. SMBus slave address is 0101100
	1	0	Internal Default Configuration via strapping options.
	1	1	2-wire (I ² C) EEPROMS are supported,

TABLE 4-3: MISCELLANEOUS PINS

Name	Symbol	Type	Function
Crystal Input/External Clock Input	XTAL1/CLKIN	ICLKx	24MHz crystal or external clock input. This pin connects to either one terminal of the crystal or to an external 24MHz clock when a crystal is not used.
Crystal Output	XTAL2	OCLKx	24MHz Crystal This is the other terminal of the crystal, or left unconnected when an external clock source is used to drive XTAL1/CLKIN. It must not be used to drive any external circuitry other than the crystal circuit.
Clock Input Enable	CLKIN_EN	I	Clock In Enable: Low = XTAL1 and XTAL2 pins configured for use with external crystal High = XTAL1 pin configured as CLKIN, and must be driven by an external CMOS clock.
RESET Input	RESET_N	IS	This active low signal is used by the system to reset the chip. The minimum active low pulse is 1us.
Self-Power / Bus-Power Detect	SELF_PWR	I	Detects availability of local self-power source. Low = Self/local power source is NOT available (i.e., Hub gets all power from Upstream USB VBus). High = Self/local power source is available.
TEST Pin	TEST	IPD	Used for testing the chip. User must treat as a no-connect or connect to ground.
Analog Test & Internal 1.8V voltage regulator enable	ATEST/REG_EN	AIO	This signal is used for testing the analog section of the chip, and to enable or disable the internal 1.8v regulator. This pin must be connected to VDDA33 to enable the internal 1.8V regulator, or to VSS to disable the internal regulator. When the internal regulator is enabled, the 1.8V power pins must be left unconnected, except for the required bypass capacitors. When the PHY is in test mode, the internal regulator is disabled and the ATEST pin functions as a test pin.

TABLE 4-4: POWER, GROUND, AND NO CONNECT

Name	Symbol	Type	Function
VDDCORE3P3	VDD33CR		+3.3V I/O Power. If the internal core 1.8V regulator is enabled, then this pin acts as the regulator input
VDD1P8	VDD18		+1.8V core power. If the internal regulator is enabled, then VDD18 pin 27 must have a 4.7 μ F (or greater) \pm 20% (ESR <0.1 Ω) capacitor to VSS
VDDAPLL3P3	VDDA33PLL		+3.3V Filtered analog power for the internal PLL If the internal PLL 1.8V regulator is enabled, then this pin acts as the regulator input
VDDAPLL1P8	VDDA18PLL		+1.8V Filtered analog power for internal PLL. If the internal regulator is enabled, then this pin must have a 4.7 μ F (or greater) \pm 20% (ESR <0.1 Ω) capacitor to VSS
VDDA3P3	VDDA33		+3.3V Filtered analog power.
VSS	VSS		Ground.

TABLE 4-5: BUFFER TYPE DESCRIPTIONS

Buffer	Description
I	Input.
IPD	Input, with a weak Internal pull-down.
IPU	Input, with a weak Internal pull-up.
IS	Input with Schmitt trigger.
I/O8	Input/Output 8mA
O8	Output 8mA
IOSD12	Open drain...12mA sink with Schmitt trigger, and must meet I ² C-Bus Specification Version 2.1 requirements.
ICLKx	XTAL Clock Input
OCLKx	XTAL Clock Output
I-R	RBIAS
IO-U	Defined in USB Specification. Note: Meets USB 1.1 requirements when operating as a 1.1-compliant device and meets USB 2.0 requirements when operating as a 2.0-compliant device.
AIO	Analog Input/output. Per PHY test requirements.

5.0 FUNCTIONAL BLOCK DESCRIPTION

5.1 2-Port Hub

Microchip's USB 2.0 2-Port Hub is fully specification compliant to the Universal Serial Bus Specification Revision 2.0 April 27, 2000 (12/7/2000 and 5/28/2002 Errata). Please reference Chapter 11 (Hub Specification) for general details regarding Hub operation and functionality.

For performance reasons, the 2-Port Hub provides 1 Transaction Translator (TT) per port (defined as Multi-TT configuration), divided into 4 non-periodic buffers per TT.

5.1.1 HUB CONFIGURATION OPTIONS

The Microchip Hub supports a large number of features and must be configured in order to correctly function when attached to a USB host controller. There are three principal ways to configure the hub: SMBus, EEPROM, or by internal default settings. In all cases, the configuration method will be determined by the CFG_SEL1 and CFG_SEL0 pins immediately after RESET_N negation.

5.1.1.1 Vendor ID

Is a 16-bit value that uniquely identifies the Vendor of the user device (assigned by USB-Interface Forum). This field is set by the OEM using either the SMBus or EEPROM interface options. When using the internal default option, Microchip's VID (see [Table 5-1](#)) will be reported.

5.1.1.2 Product ID

Is a 16-bit value that the Vendor can assign that uniquely identifies this particular product (assigned by OEM). This field is set by the OEM using either the SMBus or EEPROM interface options. When using the internal default option, Microchip's PID designation of (see [Table 5-1](#)) will be reported.

5.1.1.3 Device ID

Is a 16-bit device release number in BCD format (assigned by OEM). This field is set by the OEM using either the SMBus or EEPROM interface options. When using the internal default option, Microchip's DID designation of (see [Table 5-1](#)) will be reported.

5.1.1.4 Self-Powered/Bus-Powered

The Hub is either Self-Powered (draws less than 2mA of upstream bus power) or Bus-Powered (limited to a 100mA maximum of upstream power prior to being configured by the host controller).

When configured as a Bus-Powered device, the Microchip Hub consumes less than 100mA of current prior to being configured. After configuration, the Bus-Powered Microchip Hub (along with all associated hub circuitry, any embedded devices if part of a compound device, and 100mA per externally available downstream port) must consume no more than 500mA of upstream VBUS current. The current consumption is system dependent, and the OEM must ensure that the USB 2.0 specifications are not violated.

When configured as a Self-Powered device, <1mA of upstream VBUS current is consumed and all 7 ports are available, with each port being capable of sourcing 500mA of current.

This field is set by the OEM using either the SMBus or EEPROM interface options. When using the internal default option, the SELF_PWR pin determines the Self-powered or Bus-powered status.

Please see the description under Dynamic Power for the self/bus power functionality when dynamic power switching is enabled.

5.1.1.5 High-Speed Disable

Allows an OEM to force the Hub to configure as a Full-Speed device only (i.e. High-Speed not available).

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.6 EOP Disable

During FS operation only, this permits the Hub to send EOP if no downstream traffic is detected at EOF1. See Section 11.3.1 of the USB 2.0 Specification for additional details.

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.7 Current Sensing

Selects current sensing as all ports ganged, or none.

This field can be set by the OEM using either the SMBus or EEPROM interface options. When using the internal default option, the SELF_PWR pin determines if current sensing will be ganged, or none (ganged if self-powered, none if bus-powered).

5.1.1.8 Compound Device

Allows the OEM to indicate that the Hub is part of a compound (see the USB Specification for definition) device. The applicable port(s) must also be defined as having a "Non-Removable Device".

This field is set by the OEM using either the SMBus or EEPROM interface options.

Note: When configured via strapping options, declaring a port as non-removable automatically causes the hub controller to report that it is part of a compound device.

5.1.1.9 Non-Removable Device

Informs the Host if one of the active ports has a permanent device that is undetachable from the Hub. (Note: The device must provide its own descriptor data.)

This field is set by the OEM using either the SMBus or EEPROM interface options. When using the internal default option, the NON_REM[1:0] pins will designate the appropriate ports as being non-removable.

5.1.1.10 Self-Powered Port DISABLE

During Self-Powered operation, this selects the ports which will be permanently disabled, and are not available to be enabled or enumerated by a Host Controller. The disabled ports must be in decreasing order starting with port 2.

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.11 Bus-Powered Port DISABLE

During Bus-Powered operation, this selects the ports which will be permanently disabled, and are not available to be enabled or enumerated by a Host Controller. The disabled ports must be in decreasing order starting with port 2.

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.12 Dynamic Power

Controls the ability of the 2-Port Hub to automatically change from Self-Powered operation to Bus-Powered operation if the local power source is removed or is unavailable (and from Bus-Powered to Self-Powered if the local power source is restored). (Note: If the local power source is available, the 2-port Hub will always switch to Self-Powered operation.)

When Dynamic Power switching is enabled, the Hub detects the availability of a local power source by monitoring the external SELF_PWR pin. If the Hub detects a change in power source availability, the Hub immediately disconnects and removes power from all downstream devices and disconnects the upstream port. The Hub will then re-attach to the upstream port as either a Bus-Powered Hub (if local-power is unavailable) or a Self-Powered Hub (if local power is available).

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.13 Over-Current Timer

The time delay (in 2ms increments) for an over-current condition to persist before it is reported to the Host.

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.14 Self-Powered Max Power

When in Self-Powered configuration, Sets value in 2mA increments.

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.15 Bus-Powered Max Power

When in Bus-Powered configuration, Sets value in 2mA increments.

This field is set by the OEM using either the SMBus or EEPROM interface options.

USB2502

5.1.1.16 Self-powered Hub Controller Current

When in Self-Powered configuration, Maximum current requirements of the Hub Controller in 2mA increments. This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.17 Bus-Powered Hub Controller Current

When in Bus-Powered configuration, Maximum current requirements of the Hub Controller in 2mA increments. This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.18 Power-On Timer

Time (in 2ms intervals) from the time power-on sequence begins on a port until power is good on that port. System software uses this value to determine how long to wait before accessing a powered-on port.

This field is set by the OEM using either the SMBus or EEPROM interface options.

5.1.1.19 Power Switching Polarity

The selection of active state “polarity” for the PRTPWR2 pin is made by a strapping option only.

5.1.2 VBUS DETECT

According to Section 7.2.1 of the USB 2.0 Specification, a downstream port can never provide power to its D+ or D- pull-up resistors unless the upstream port's VBUS is in the asserted (powered) state. The VBUS_DET pin on the Hub monitors the state of the upstream VBUS signal and will not pull-up the D+ or D- resistor if VBUS is not active. If VBUS goes from an active to an inactive state (Not Powered), Hub will remove power from the D+ or D- pull-up resistor within 10 seconds.

5.2 EEPROM Interface

The Microchip Hub can be configured via a 2-wire (I²C) EEPROM. (Please see [Table 4-1, "2-Port Hub Pin Descriptions"](#) for specific details on how to enable the I²C EEPROM option).

The Internal state-machine will, (when configured for EEPROM support) read the external EEPROM for configuration data. The hub will then “attach” to the upstream USB host.

Please see [Table 5-1 User-Defined Descriptor Data](#) for a list of data fields available.

5.2.1 I²C EEPROM

The I²C EEPROM interface implements a subset of the I²C Master Specification (Please refer to the Philips Semiconductor Standard I²C-Bus Specification for details on I²C bus protocols). The Hub's I²C EEPROM interface is designed to attach to a single “dedicated” I²C EEPROM, and it conforms to the Standard-mode I²C Specification (100kbit/s transfer rate and 7-bit addressing) for protocol and electrical compatibility.

Note: Extensions to the I²C Specification are not supported.

The Hub acts as the master and generates the serial clock SCL, controls the bus access (determines which device acts as the transmitter and which device acts as the receiver), and generates the START and STOP conditions.

5.2.1.1 Implementation Characteristics

Please refer to the MicroChip 24AA00 DataSheet for Protocol and Programming specifics.

5.2.1.2 Pull-Up Resistor

The Circuit board designer is required to place external pull-up resistors (10KΩ recommended) on the SDA/SMBDATA & SCL/SMBCLK/CFG_SELO lines (per SMBus 1.0 Specification, and EEPROM manufacturer guidelines) to Vcc in order to assure proper operation.

5.2.1.3 I²C EEPROM Slave Address

Slave address is 1010000.

Note: 10-bit addressing is NOT supported.

5.2.2 IN-CIRCUIT EEPROM PROGRAMMING

The EEPROM can be programmed via ATE by pulling RESET_N low (which tri-states the Hub's EEPROM interface and allows an external source to program the EEPROM).

5.2.3 EEPROM DATA

TABLE 5-1: USER-DEFINED DESCRIPTOR DATA

Field	Byte MSB: LSB	Size (Bytes)	Default CFG Self (Hex)	Default CFG Bus (Hex)	Description
VID	1:0	2	0424	0424	Vendor ID (assigned by USB-IF).
PID	3:2	2	2502	2502	Product ID (assigned by Manufacturer).
DID	5:4	2	0000	0000	Device ID (assigned by Manufacturer).
Config Data Byte 1	6	1	88	0C	Configuration data byte #1 for Hub options.
Config Data Byte 2	7	1	90	90	Configuration data byte #2 for Hub options.
Non Removable Device	8	1	00	00	Defines the ports that contain attached devices (this is used only when Hub is part of a compound device).
Port Disable Self-Powered	9	1	00	00	Selects the ports that will be permanently disabled
Port Disable Bus-Powered	A	1	00	00	Selects the ports that will be permanently disabled
Max Power Self-Powered	B	1	01	01	Max Current for this configuration (expressed in 2mA units).
Max Power Bus-Powered	C	1	64	64	Max Current for this configuration (expressed in 2mA units).
Hub Controller Max Current Self-Powered	D	1	01	01	Max Current (expressed in 2mA units).
Hub Controller Max Current Bus-Powered	E	1	64	64	Max Current (expressed in 2mA units).
Power-On Time	F	1	32	32	Time until power is stable.

5.2.3.1 EEPROM Offset 1:0(h) - Vendor ID

Bit Number	Bit Name	Description
15:8	VID_MSB	Most Significant Byte of the Vendor ID.
7:0	VID_LSB	Least Significant Byte of the Vendor ID.

5.2.3.2 EEPROM Offset 3:2(h) - Product ID

Bit Number	Bit Name	Description
15:8	PID_MSB	Most Significant Byte of the Product ID.
7:0	PID_LSB	Least Significant Byte of the Product ID.

USB2502

5.2.3.3 EEPROM Offset 5:4(h) - Device ID

Bit Number	Bit Name	Description
15:8	DID_MSB	Most Significant Byte of the Device ID.
7:0	DID_LSB	Least Significant Byte of the Device ID.

5.2.3.4 EEPROM Offset 6(h) - CONFIG_BYTE_1

Bit Number	Bit Name	Description
7	SELF_BUS_PWR	Self or Bus Power: Selects between Self- and Bus-Powered operation. 0 = Bus-Powered operation. (BUS Default) 1 = Self-Powered operation. (SELF Default) Note: If Dynamic Power Switching is enabled, this bit is ignored and the SELF_PWR pin is used to determine if the hub is operating from self or bus power.
6	Reserved	Reserved
5	HS_DISABLE	High Speed Disable: Disables the capability to attach as either a High/Full-speed device, and forces attachment as Full-speed only i.e. (no High-Speed support). 0 = High-/Full-Speed. (Default) 1 = Full-Speed-Only (High-Speed disabled!)
4	Reserved	Reserved
3	EOP_DISABLE	EOP Disable: Disables EOP generation at EOF1 when no downstream directed traffic is in progress. 0 = EOP generation at EOF1 is enabled. 1 = EOP generation at EOF1 is disabled, (normal operation). (Default)
2:1	CURRENT_SNS	Over Current Sense: Indicates whether current sensing is ganged. 00 = Ganged sensing (all ports together). (Default for self-power) 01 = Reserved 1x = Over current sensing not supported. (may be used with Bus-Powered configurations only!, and is the default for bus-power)
0	Reserved	Reserved

5.2.3.5 EEPROM Offset 7(h) - CONFIG_BYTE_2

Bit Number	Bit Name	Description
7	DYNAMIC	Dynamic Power Enable: Controls the ability for the Hub to transition to Bus-Powered operation if the local power source is removed (can revert back to Self-Power if local power source is restored). 0 = No Dynamic auto-switching. 1 = Dynamic Auto-switching capable.(Default)
6	Reserved	Reserved
5:4	OC_TIMER	OverCurrent Timer: Over Current Timer delay. 00 = 0.1ms 01 = 2ms (Default) 10 = 4ms 11 = 6ms
3	COMPOUND	Compound Device: Designates if Hub is part of a compound device. 0 = No. (Default) 1 = Yes, Hub is part of a compound device.
2:0	Reserved	Reserved.

5.2.3.6 EEPROM Offset 8(h) - Non-Removable Device

Bit Number	Bit Name	Description
7:0	NR_DEVICE	Non-Removable Device: Indicates which port(s) include non-removable devices. '0' = port is removable, '1' = port is non-removable. Bit 7:3= 0; Reserved Bit 2= 1; Port 2 non-removable. Bit 1= 1; Port 1 non removable. Bit 0 is Reserved, always = '0'.

5.2.3.7 EEPROM Offset 9(h) - Port Disable For Self Powered Operation

Bit Number	Bit Name	Description
7:0	PORT_DIS_SP	Port Disable Self-Powered: Disables 1 or more contiguous ports. '0' = port is available, '1' = port is disabled. Bit 7:3= 0; Reserved Bit 2= 1; Port 2 is disabled. Bit 1= 1; Port 1 is disabled. Bit 0 is Reserved, always = '0'

5.2.3.8 EEPROM Offset A(h) - Port Disable For Bus Powered Operation

Bit Number	Bit Name	Description
7:0	PORT_DIS_BP	Port Disable Bus-Powered: Disables 1 or more contiguous ports. '0' = port is available, '1' = port is disabled. Bit 7:3= 0; Reserved Bit 2= 1; Port 2 is disabled. Bit 1= 1; Port 1 is disabled. Bit 0 is Reserved, always = '0'

5.2.3.9 EEPROM Offset B(h) - Max Power For Self Powered Operation

Bit Number	Bit Name	Description
7:0	MAX_PWR_SP	Max Power Self_Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0mA in its descriptors. Note: The USB 2.0 Specification does not permit this value to exceed 100mA A value of 50 (decimal) indicates 100mA.

5.2.3.10 EEPROM Offset C(h) - Max Power For Bus Powered Operation

Bit Number	Bit Name	Description
7:0	MAX_PWR_BP	Max Power Bus_Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0mA in its descriptors. A value of 50 (decimal) indicates 100mA.

USB2502

5.2.3.11 EEPROM Offset D(h) - Hub Controller Max Current For Self Powered Operation

Bit Number	Bit Name	Description
7:0	HC_MAX_C_SP	<p>Hub Controller Max Current Self-Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value does NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device.</p> <p>Note: The USB 2.0 Specification does not permit this value to exceed 100mA</p> <p>A value of 50 (decimal) indicates 100mA, which is the default value.</p>

5.2.3.12 EEPROM Offset E(h) - Hub Controller Max Current For Bus Powered Operation

Bit Number	Bit Name	Description
7:0	HC_MAX_C_BP	<p>Hub Controller Max Current Bus-Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value does NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device.</p> <p>A value of 50 (decimal) indicates 100mA, which is the default value.</p>

5.2.3.13 EEPROM Offset F(h) - Power-On Time

Bit Number	Bit Name	Description
7:0	POWER_ON_TIME	<p>Power On Time: The length of time that it takes (in 2 ms intervals) from the time the host initiated power-on sequence begins on a port until power is good on that port.</p>

5.3 SMBus Slave Interface

Instead of loading User-Defined Descriptor data from an external EEPROM, the Microchip Hub can be configured to receive a code load from an external processor via an SMBus interface. The SMBus interface shares the same pins as the EEPROM interface, if CFG_SEL1 & CFG_SEL0 activates the SMBus interface, external EEPROM support is no longer available (and the user-defined descriptor data must be downloaded via the SMBus). Due to system issues, the Microchip Hub waits indefinitely for the SMBus code load to complete and only “appears” as a newly connected device on USB after the code load is complete.

The Hub's SMBus implementation is a subset of the SMBus interface to the host. The device is a *slave-only* SMBus device. The implementation in the device is a subset of SMBus since it only supports two protocols.

The Write Byte and Read Byte protocols are the only valid SMBus protocols for the Hub. The Hub responds to other protocols as described in [Section 5.3.2, "Invalid Protocol Response Behavior," on page 19](#). Reference the System Management Bus Specification, Rev 1.0.

The SMBus interface is used to read and write the registers in the device. The register set is shown in [Section 5.3.9, "Internal SMBus Memory Register Set," on page 20](#).

5.3.1 BUS PROTOCOLS

Typical Write Byte and Read Byte protocols are shown below. Register accesses are performed using 7-bit slave addressing, an 8-bit register address field, and an 8-bit data field. The shading indicates the Hub driving data on the SMBDATA line; otherwise, host data is on the SDA/SMBDATA line.

The slave address is the unique SMBus Interface Address for the Hub that identifies it on SMBus. The register address field is the internal address of the register to be accessed. The register data field is the data that the host is attempting to write to the register or the contents of the register that the host is attempting to read.

Note: Data bytes are transferred MSB first (msb first).

5.3.1.1 Byte Protocols

When using the Hub SMBus Interface for byte transfers, a write will always consist of the SMBus Interface Slave Address byte, followed by the Internal Address Register byte, then the data byte.

The normal read protocol consists of a write to the HUB with the SMBus Interface Address byte, followed by the Internal Address Register byte. Then restart the Serial Communication with a Read consisting of the SMBus Interface Address byte, followed by the data byte read from the Hub. This can be accomplished by using the Read Byte protocol.

Note: For the following SMBus tables:

Denotes Master-to-Slave

Denotes Slave-to-Master

Write Byte

The Write Byte protocol is used to write data to the registers. The data will only be written if the protocol shown in [Table 5-2](#) is performed correctly. Only one byte is transferred at a time for a Write Byte protocol.

TABLE 5-2: SMBUS WRITE BYTE PROTOCOL

Field:	Start	Slave Addr	Wr	Ack	Reg. Addr	Ack	Reg. Data	Ack	Stop
Bits:	1	7	1	1	8	1	8	1	1

Read Byte

The Read Byte protocol is used to read data from the registers. The data will only be read if the protocol shown in [Table 5-3](#) is performed correctly. Only one byte is transferred at a time for a Read Byte protocol.

TABLE 5-3: SMBUS READ BYTE PROTOCOL

Field:	Start	Slave Addr	Wr	Ack	Reg. Addr	Ack	Start	Slave Addr	Rd	Ack	Reg. Data	Nack	Stop
Bits:	1	7	1	1	8	1	1	7	1	1	8	1	1

5.3.2 INVALID PROTOCOL RESPONSE BEHAVIOR

Registers that are accessed with an invalid protocol are not updated. A register is only updated following a valid protocol. The only valid protocols are Write Byte and Read Byte, which are described above.

The Hub only responds to the hardware selected Slave Address.

Attempting to communicate with the Hub over SMBus with an invalid slave address or invalid protocol results in no response, and the SMBus Slave Interface returns to the idle state.

The only valid registers that are accessible by the SMBus slave address are the registers defined in the Registers Section. See [Section 5.3.3](#) for the response to undefined registers.

5.3.3 GENERAL CALL ADDRESS RESPONSE

The Hub does not respond to a general call address of 0000_000b.

5.3.4 SLAVE DEVICE TIME-OUT

According to the SMBus Specification, V1.0 devices in a transfer can abort the transfer in progress and release the bus when any single clock low interval exceeds 25ms ($T_{\text{TIMEOUT, MIN}}$). Devices that have detected this condition must reset their communication and be able to receive a new START condition no later than 35ms ($T_{\text{TIMEOUT, MAX}}$).

USB2502

Note: Some simple devices do not contain a clock low drive circuit; this simple kind of device typically resets its communications port after a start or stop condition.

5.3.5 STRETCHING THE SCLK SIGNAL

The Hub supports stretching of the SCLK by other devices on the SMBus. The Hub does not stretch the SCLK.

5.3.6 SMBUS TIMING

The SMBus Slave Interface complies with the SMBus AC Timing Specification. See the SMBus timing in the “Timing Diagram” section.

5.3.7 BUS RESET SEQUENCE

The SMBus Slave Interface resets and returns to the idle state upon a START field followed immediately by a STOP field.

5.3.8 SMBUS ALERT RESPONSE ADDRESS

The SMBALERT# signal is not supported by the Hub.

5.3.9 INTERNAL SMBUS MEMORY REGISTER SET

The following table provides the SMBus slave interface register map values.

TABLE 5-4: SMBUS SLAVE INTERFACE REGISTER MAP

Reg Addr	R/W	Register Name	Abbr	Bit 7 (MSb)	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0 (LSb)
00h	R/W	Status/Command	STCD	7	6	5	4	3	2	1	0
01h	R/W	VID LSB	VIDL	7	6	5	4	3	2	1	0
02h	R/W	VID MSB	VIDM	7	6	5	4	3	2	1	0
03h	R/W	PID LSB	PIDL	7	6	5	4	3	2	1	0
04h	R/W	PID MSB	PIDM	7	6	5	4	3	2	1	0
05h	R/W	DID LSB	DIDL	7	6	5	4	3	2	1	0
06h	R/W	DID MSB	DIDM	7	6	5	4	3	2	1	0
07h	R/W	Config Data Byte 1	CFG1	7	6	5	4	3	2	1	0
08h	R/W	Config Data Byte 2	CFG2	7	6	5	4	3	2	1	0
09h	R/W	Non-Removable Devices	NRD	7	6	5	4	3	2	1	0
0Ah	R/W	Port Disable (Self)	PDS	7	6	5	4	3	2	1	0
0Bh	R/W	Port Disable (Bus)	PDB	7	6	5	4	3	2	1	0
0Ch	R/W	Max Power (Self)	MAXPS	7	6	5	4	3	2	1	0
0Dh	R/W	Max Power (Bus)	MAXPB	7	6	5	4	3	2	1	0
0Eh	R/W	Hub Controller Max Current (Self)	HCMCS	7	6	5	4	3	2	1	0
0Fh	R/W	Hub Controller Max Current (bus)	HCMCB	7	6	5	4	3	2	1	0
10h	R/W	Power-on Time	PWRT	7	6	5	4	3	2	1	0

5.3.9.1 Register 00h: Status/Command (Reset = 0x00)

Bit Number	Bit Name	Description
7:3	Reserved	Reserved. {Note: Software must never write a '1' to these bits}
2	RESET	Reset the SMBus Interface and internal memory back to RESET_N assertion default settings. {Note: During this reset, this bit is automatically cleared to its default value of 0.} 0 = Normal Run/Idle State. 1 = Force a reset.
1	WRITE_PROT	Write Protect: The external SMBus host sets this bit after the Hub's internal memory is loaded with configuration data. {Note: The External SMBus Host is responsible for verification of downloaded data.} 0 = The internal memory (address range 01-10h) is not write protected. 1 = The internal memory (address range 01-10h) is "write-protected" to prevent unintentional data corruption. Note: {This bit is write once and is only cleared by assertion of the external RESET_N pin.}
0	USB_ATTACH	USB Attach & power-down the SMBus Interface. 0 = Default; SMBus slave interface is active. 1 = Hub will signal a USB attach event to an upstream device, Note: SMBus Slave interface will completely power down after the ACK has completed. Note: {This bit is write once and is only cleared by assertion of the external RESET_N pin.}

5.3.9.2 Register 01h: Vendor ID (LSB) (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	VID_LSB	Least Significant Byte of the Vendor ID.

5.3.9.3 Register 02h: Vendor ID (MSB) (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	VID_MSB	Most Significant Byte of the Vendor ID.

5.3.9.4 Register 03h: Product ID (LSB) (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	PID_LSB	Least Significant Byte of the Product ID.

5.3.9.5 Register 04h: Product ID (MSB) (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	PID_MSB	Most Significant Byte of the Product ID.

5.3.9.6 Register 05h: Device ID (LSB) (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	DID_LSB	Least Significant Byte of the Device ID.

USB2502

5.3.9.7 Register 06h: Device ID (MSB) (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	DID_MSB	Most Significant Byte of the Device ID.

5.3.9.8 Register 07h: CONFIG_BYTE_1 (Reset = 0x00)

Bit Number	Bit Name	Description
7	SELF_BUS_PWR	Self or Bus Power: Selects between Self- and Bus-Powered operation. 0 = Bus-Powered operation. 1 = Self-Powered operation. Note: If Dynamic Power Switching is enabled, this bit is ignored and the SELF_PWR pin is used to determine if the hub is operating from self or bus power.
6	Reserved	Reserved
5	HS_DISABLE	High Speed Disable: Disables the capability to attach as either a High/Full-speed device, and forces attachment as Full-speed only i.e. (no High-Speed support). 0 = High-/Full-Speed. 1 = Full-Speed-Only (High-Speed disabled!)
4	Reserved	Reserved
3	EOP_DISABLE	EOP Disable: Disables EOP generation of EOF1 when in Full-Speed mode. 0 = EOP generation is normal. 1 = EOP generation is disabled.
2:1	CURRENT_SNS	Over Current Sense: Indicates whether current sensing is ganged. 00 = Ganged sensing (all ports together). 01 = Reserved 1x = Over current sensing not supported. (must only be used with Bus-Powered configurations!)
0	Reserved	Reserved

5.3.9.9 Register 08h: Configuration Data Byte 2 (Reset = 0x00)

Bit Number	Bit Name	Description
7	DYNAMIC	Dynamic Power Enable: Controls the ability for the Hub to transition to Bus-Powered operation if the local power source is removed (can revert back to Self-Power if local power source is restored). 0 = No Dynamic auto-switching. 1 = Dynamic Auto-switching capable.
6	Reserved	Reserved
5:4	OC_TIMER	OverCurrent Timer: Over Current Timer delay. 00 = 0.1ms 01 = 2ms 10 = 4ms 11 = 6ms
3	COMPOUND	Compound Device: Designates if Hub is part of a compound device. 0 = No. 1 = Yes, Hub is part of a compound device.
2:0	Reserved	Reserved

5.3.9.10 Register 09h: Non-Removable Device (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	NR_DEVICE	<p>Non-Removable Device: Indicates which port(s) include non-removable devices. '0' = port is removable, '1' = port is non-removable.</p> <p>Bit 7:3: Reserved, always = '0' Bit 2= 1; Port 2 non-removable. Bit 1= 1; Port 1 non removable. Bit 0 is Reserved, always = '0'.</p>

5.3.9.11 Register 0Ah: Port Disable For Self Powered Operation (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	PORT_DIS_SP	<p>Port Disable Self-Powered: Disables 1 or more contiguous ports. '0' = port is available, '1' = port is disabled.</p> <p>Bit 7:3= 0; Reserved Bit 2= 1; Port 2 is disabled. Bit 1= 1; Port 1 is disabled. Bit 0 is Reserved, always = '0'</p>

5.3.9.12 Register 0Bh: Port Disable For Bus Powered Operation (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	PORT_DIS_BP	<p>Port Disable Bus-Powered: Disables 1 or more contiguous ports. '0' = port is available, '1' = port is disabled.</p> <p>Bit 7:3= 0; Reserved Bit 2= 1; Port 2 is disabled. Bit 1= 1; Port 1 is disabled. Bit 0 is Reserved, always = '0'</p>

5.3.9.13 Register 0Ch: Max Power For Self Powered Operation (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	MAX_PWR_SP	<p>Max Power Self_Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0mA in its descriptors.</p> <p>Note: The USB 2.0 Specification does not permit this value to exceed 100mA</p> <p>A value of 50 (decimal) indicates 100mA.</p>

5.3.9.14 Register 0Dh: Max Power For Bus Powered Operation (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	MAX_PWR_BP	<p>Max Power Bus_Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value also includes the power consumption of a permanently attached peripheral if the hub is configured as a compound device, and the embedded peripheral reports 0mA in its descriptors.</p> <p>A value of 50 (decimal) indicates 100mA.</p>

USB2502

5.3.9.15 Register 0Eh: Hub Controller Max Current For Self Powered Operation (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	HC_MAX_C_SP	Hub Controller Max Current Self-Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a self-powered hub. This value includes the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value does NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device. Note: The USB 2.0 Specification does not permit this value to exceed 100mA A value of 50 (decimal) indicates 100mA, which is the default value.

5.3.9.16 Register 0Fh: Hub Controller Max Current For Bus Powered Operation (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	HC_MAX_C_BP	Hub Controller Max Current Bus-Powered: Value in 2mA increments that the Hub consumes from an upstream port (VBUS) when operating as a bus-powered hub. This value will include the hub silicon along with the combined power consumption (from VBUS) of all associated circuitry on the board. This value will NOT include the power consumption of a permanently attached peripheral if the hub is configured as a compound device. A value of 50 (decimal) would indicate 100mA, which is the default value.

5.3.9.17 Register 10h: Power-On Time (Reset = 0x00)

Bit Number	Bit Name	Description
7:0	POWER_ON_TIME	Power On Time: The length of time that it takes (in 2 ms intervals) from the time the host initiated power-on sequence begins on a port until power is good on that port.

5.3.9.18 Undefined Registers

The registers shown in [Table 5-4](#) are the defined registers in the Hub. Reads to undefined registers return 00h. Writes to undefined registers have no effect and do not return an error.

5.3.9.19 Reserved Registers

Unless otherwise instructed, only a '0' may be written to all reserved registers or bits.

5.4 Default Configuration Option:

The Microchip Hub can be configured via its internal default configuration. (please see for specific details on how to enable default configuration.

Please refer to [Table 5-1 on page 15](#) for the internal default values that are loaded when this option is selected.

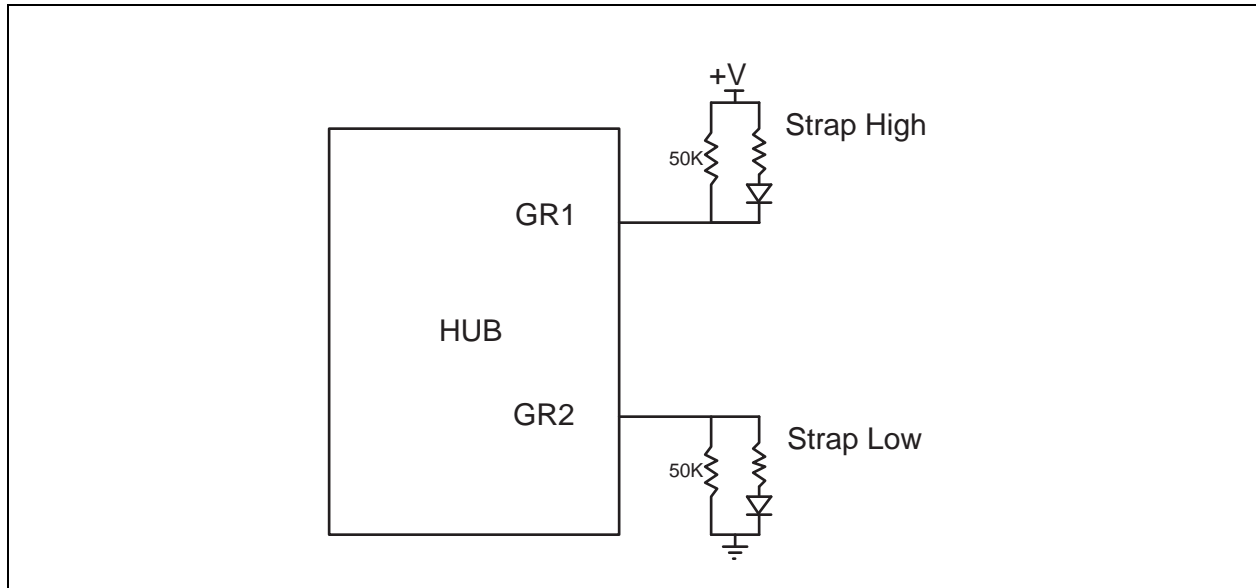

5.5 Default Strapping Options:

The Microchip Hub can be configured via a combination of internal default values and pin strap options. Please see [Table 4-1, "2-Port Hub Pin Descriptions"](#) for specific details on how to enable the default/pin-strap configuration option.

The strapping option pins only cover a limited sub-set of the configuration options. The internal default values will be used for the bits & registers that are not controlled by a strapping option pin. Please refer to [Table 5-1 on page 15](#) for the internal default values that are loaded when this option is selected.

The Green LED pins are sampled after RESET_N negation, and the logic values are used to configure the hub if the internal default configuration mode is selected. The implementation shown below (see Figure 5-1) shows a recommended passive scheme. When a pin is configured with a “Strap High” configuration, the LED functions with active low signaling, and the PAD will “sink” the current from the external supply. When a pin is configured with a “Strap Low” configuration, the LED functions with active high signaling, and the PAD will “source” the current to the external LED.

FIGURE 5-1: LED STRAPPING OPTION

5.6 Reset

There are two different resets that the Hub experiences. One is a hardware reset (via the RESET_N pin) and the second is a USB Bus Reset.

5.6.1 EXTERNAL HARDWARE RESET_N

A valid hardware reset is defined as, assertion of RESET_N for a minimum of 1us after all power supplies are within operating range. While reset is asserted, the Hub (and its associated external circuitry) consumes less than 500μA of current from the upstream USB power source (300μA for the Hub and 200μA for the external circuitry).

Assertion of RESET_N (external pin) causes the following:

1. All downstream ports are disabled, and PRTPWR power to downstream devices is removed.
2. The PHYs are disabled, and the differential pairs will be in a high-impedance state.
3. All transactions immediately terminate; no states are saved.
4. All internal registers return to the default state (in most cases, 00(h)).
5. The external crystal oscillator is halted.
6. The PLL is halted.
7. LED indicators are disabled.

The Hub is “operational” 500μs after RESET_N is negated.

Once operational, the Hub immediately reads OEM-specific data from the external EEPROM (if the SMBus option is not disabled).

5.6.1.1 RESET_N for Strapping Option Configuration

FIGURE 5-2: RESET_N TIMING FOR DEFAULT/STRAP OPTION MODE

TABLE 5-5: RESET_N TIMING FOR DEFAULT/STRAP OPTION MODE

Name	Description	MIN	TYP	MAX	Units
t1	RESET_N Asserted.	1			μ sec
t2	Strap Setup Time	16.7			nsec
t3	Strap Hold Time.	16.7		1400	nsec
t4	hub outputs driven to inactive logic states		2.0	1.5	μ sec
t5	USB Attach (See Note).			100	msec
t6	Host acknowledges attach and signals USB Reset.	100			msec
t7	USB Idle.		undefined		msec
t8	Completion time for requests (with or without data stage).			5	msec

Note 1: When in Bus-Powered mode, the Hub and its associated circuitry must not consume more than 100mA from the upstream USB power source during t_1+t_5 .

2: All Power Supplies must have reached the operating levels mandated in [Section 7.0, "DC Parameters"](#), prior to (or coincident with) the assertion of RESET_N.

5.6.1.2 RESET_N for EEPROM Configuration

FIGURE 5-3: RESET_N TIMING FOR EEPROM MODE

TABLE 5-6: RESET_N TIMING FOR EEPROM MODE

Name	Description	MIN	TYP	MAX	Units
t1	RESET_N Asserted.	1			μsec
t2	Hub Recovery/Stabilization.			500	μsec
t3	EEPROM Read / Hub Config.		2.0	99.5	msec
t4	USB Attach (See Note).			100	msec
t5	Host acknowledges attach and signals USB Reset.	100			msec
t6	USB Idle.		undefined		msec
t7	Completion time for requests (with or without data stage).			5	msec

Note 1: When in Bus-Powered mode, the Hub and its associated circuitry must not consume more than 100mA from the upstream USB power source during t4+t5+t6+t7.

2: All Power Supplies must have reached the operating levels mandated in [Section 7.0, "DC Parameters"](#), prior to (or coincident with) the assertion of RESET_N.

5.6.1.3 RESET_N for SMBus Slave Configuration

FIGURE 5-4: RESET_N TIMING FOR SMBUS MODE

TABLE 5-7: RESET_N TIMING FOR SMBUS MODE

Name	Description	MIN	TYP	MAX	Units
t1	RESET_N Asserted.	1			μsec
t2	Hub Recovery/Stabilization.			500	μsec
t3	SMBus Code Load (See Note).		10	99.5	msec
t4	Hub Configuration and USB Attach.			100	msec
t5	Host acknowledges attach and signals USB Reset.	100			msec
t6	USB Idle.		Undefined		msec
t7	Completion time for requests (with or without data stage).			5	msec

Note 1: For Bus-Powered configurations, the 99.5ms (MAX) is required, and the Hub and its associated circuitry must not consume more than 100mA from the upstream USB power source during t2+t3+t4+t5+t6+t7. For Self-Powered configurations, t3 MAX is not applicable and the time to load the configuration is determined by the external SMBus host.

2: All Power Supplies must have reached the operating levels mandated in [Section 7.0, "DC Parameters"](#), prior to (or coincident with) the assertion of RESET_N.

5.6.2 USB BUS RESET

In response to the upstream port signaling a reset to the Hub, the Hub does the following:

Note: The Hub does not propagate the upstream USB reset to downstream devices.

1. Sets default address to 0.
2. Sets configuration to: Unconfigured.
3. Negates PRT_PWR to all downstream ports.
4. Clears all TT buffers.
5. Moves device from suspended to active (if suspended).
6. Complies with Section 11.10 of the USB 2.0 Specification for behavior after completion of the reset sequence.

The Host then configures the Hub and the Hub's downstream port devices in accordance with the USB Specification.

6.0 XNOR TEST

XNOR continuity tests all signal pins on the Hub (every pin except for NC, XTAL1/CLKIN, XTAL2, ATEST/REG_EN, RBIAS, TEST, Power, and Ground). This functionality is enabled by driving TEST and CFG_SEL[1] high, driving SCLK low and transition RESET_N from low to high. The output from the XNOR chain is driven to GR2. For each pin tested for continuity GR2 should toggle.

USB2502

7.0 DC PARAMETERS

7.1 Maximum Ratings

Parameter	Symbol	MIN	MAX	Units	Comments
Storage Temperature	T_A	-55	150	°C	
Lead Temperature			325	°C	Soldering < 10 seconds
1.8V supply voltage	$V_{DDA18PLL}$ V_{DD18}	-0.3	2.5	V	
3.3V supply voltage	V_{DDA33} $V_{DDA33PLL}$ V_{DD33CR}	-0.3	4.0	V	
Voltage on any I/O pin		-0.3	$(3.3V \text{ supply voltage} + 2) \leq 6$	V	
Voltage on XTAL1		-0.3	4.0	V	
Voltage on XTAL2		-0.3	$V_{DD18} + 0.3V$	V	

Note: Stresses above the specified parameters could cause permanent damage to the device. This is a stress rating only and functional operation of the device at any condition above those indicated in the operation sections of this specification is not implied. When powering this device from laboratory or system power supplies, it is important that the Absolute Maximum Ratings not be exceeded or device failure can result. Some power supplies exhibit voltage spikes on their outputs when the AC power is switched on or off. In addition, voltage transients on the AC power line may appear on the DC output. When this possibility exists, it is suggested that a clamp circuit be used.

7.2 Recommended Operating Conditions

Parameter	Symbol	MIN	MAX	Units	Comments
Operating Temperature	T_A	0	70	°C	
1.8V supply voltage	$V_{DDA18PLL}$ V_{DD18}	1.62	1.98	V	
3.3V supply voltage	V_{DDA33} $V_{DDA33PLL}$ V_{DD33CR}	3.0	3.6	V	
Voltage on any I/O pin		-0.3	5.5	V	If any 3.3V supply voltage drops below 3.0V, then the MAX becomes: $(3.3V \text{ supply voltage} + 0.5)$
Voltage on XTAL1		-0.3	V_{DDA33}	V	
Voltage on XTAL2		-0.3	V_{DD18}	V	

TABLE 7-1: DC ELECTRICAL CHARACTERISTICS

Parameter	Symbol	MIN	TYP	MAX	Units	Comments
I, IS Type Input Buffer						
Low Input Level	V_{ILI}			0.8	V	TTL Levels
High Input Level	V_{IHI}	2.0			V	
Input Leakage	I_{IL}	-10		+10	μ A	$V_{IN} = 0$ to V_{DD33CR}
Hysteresis ('IS' Only)	V_{HYSI}	250	300	350	mV	
Input Buffer with Pull-Up (IPU)						
Low Input Level	V_{ILI}			0.8	V	TTL Levels
High Input Level	V_{IHI}	2.0			V	
Low Input Leakage	I_{ILL}	+5		+45	μ A	$V_{IN} = 0$
High Input Leakage	I_{IHL}	-10		+10	μ A	$V_{IN} = V_{DD33CR}$
Input Buffer with Pull-Down IPD						
Low Input Level	V_{ILI}			0.8	V	TTL Levels
High Input Level	V_{IHI}	2.0			V	
Low Input Leakage	I_{ILL}	+10		-10	μ A	$V_{IN} = 0$
High Input Leakage	I_{IHL}	-80		-160	μ A	$V_{IN} = V_{DD33CR}$
ICLK Input Buffer						
Low Input Level	V_{ILCK}			0.8	V	TTL Levels
High Input Level	V_{IHCK}	2.0			V	
Input Leakage	I_{IL}	-10		+10	μ A	$V_{IN} = 0$ to V_{DD33CR}
Hysteresis	V_{HYSI}	50		100	mV	
O8 and I/O8 Type Buffer						
Low Output Level	V_{OL}			0.4	V	$I_{OL} = 8$ mA @ $V_{DD33CR} = 3.3$ V
High Output Level	V_{OH}	2.4			V	$I_{OH} = -4$ mA @ $V_{DD33CR} = 3.3$ V
Output Leakage	I_{OL}	-10		+10	μ A	$V_{IN} = 0$ to V_{DD33CR} (Note 1)
I/OSD12 Type Buffer						
Low Output Level	V_{OL}			0.4	V	$I_{OL} = 12$ mA @ $V_{DD33CR} = 3.3$ V
Output Leakage	I_{OL}	-10		+10	μ A	$V_{IN} = 0$ to V_{DD33CR} (Note 1)
Hysteresis	V_{HYSI}	250	300	350	mV	

USB2502

TABLE 7-1: DC ELECTRICAL CHARACTERISTICS (CONTINUED)

Parameter	Symbol	MIN	TYP	MAX	Units	Comments
IO-U (Note 2)						
I-R (Note 3)						
Supply Current Unconfigured						
High-Speed Host Full-Speed Host	I_{CCINIT} I_{CCINIT}		73 65		mA mA	
Supply Current Configured (High-Speed Host)						Total from all supplies
2 Ports @ FS/LS 2 Ports @ HS 1 Port HS, 1 Port FS/LS	I_{HCC2} I_{HCH2} I_{HCH1C1}		120 170 140		mA mA mA	
Supply Current Configured (Full-Speed Host)						Total from all supplies
1 Port 2 Ports	I_{FCC1} I_{FCC2}		90 90		mA mA	
Supply Current Suspend	I_{CSBY}		320	425	uA	Total from all supplies.
Supply Current Reset	I_{RST}		160	300	uA	Total from all supplies.

Note 1: Output leakage is measured with the current pins in high impedance.

2: See USB 2.0 Specification for USB DC electrical characteristics.

3: RBIAS is a 3.3V tolerant analog pin.

CAPACITANCE $T_A = 25^\circ\text{C}$; $f_c = 1\text{MHz}$; $V_{DD33CR} = 3.3\text{V}$

Parameter	Symbol	Limits			Unit	Test Condition
		MIN	TYP	MAX		
Clock Input Capacitance	C_{IN}			12	pF	All pins except USB pins (and pins under test tied to AC ground)
Input Capacitance	C_{IN}			8	pF	
Output Capacitance	C_{OUT}			12	pF	

Power Sequencing

There are no power supply sequence restrictions for the Hub. The order in which power supplies power-up and power-down is implementation dependent.

8.0 AC SPECIFICATIONS

8.1 Oscillator/Clock

Crystal: Parallel Resonant, Fundamental Mode, 24 MHz \pm 100ppm.

External Clock: 50% Duty cycle \pm 10%, 24 MHz \pm 100ppm, Jitter < 100ps rms.

8.1.1 SMBUS INTERFACE:

The Microchip Hub conforms to all voltage, power, and timing characteristics and specifications as set forth in the SMBus 1.0 Specification for Slave-Only devices (except as noted in [Section 5.3](#)).

8.1.2 I²C EEPROM:

Frequency is fixed at 59KHz \pm 20%.

8.1.3 USB 2.0

The Hub conforms to all voltage, power, and timing characteristics and specifications as set forth in the USB 2.0 Specification. Please refer to the USB Specification for more information.

9.0 PACKAGE OUTLINES

FIGURE 9-1: 36-PIN QFN PACKAGE OUTLINE (6X6MM BODY - 0.5MM PITCH)

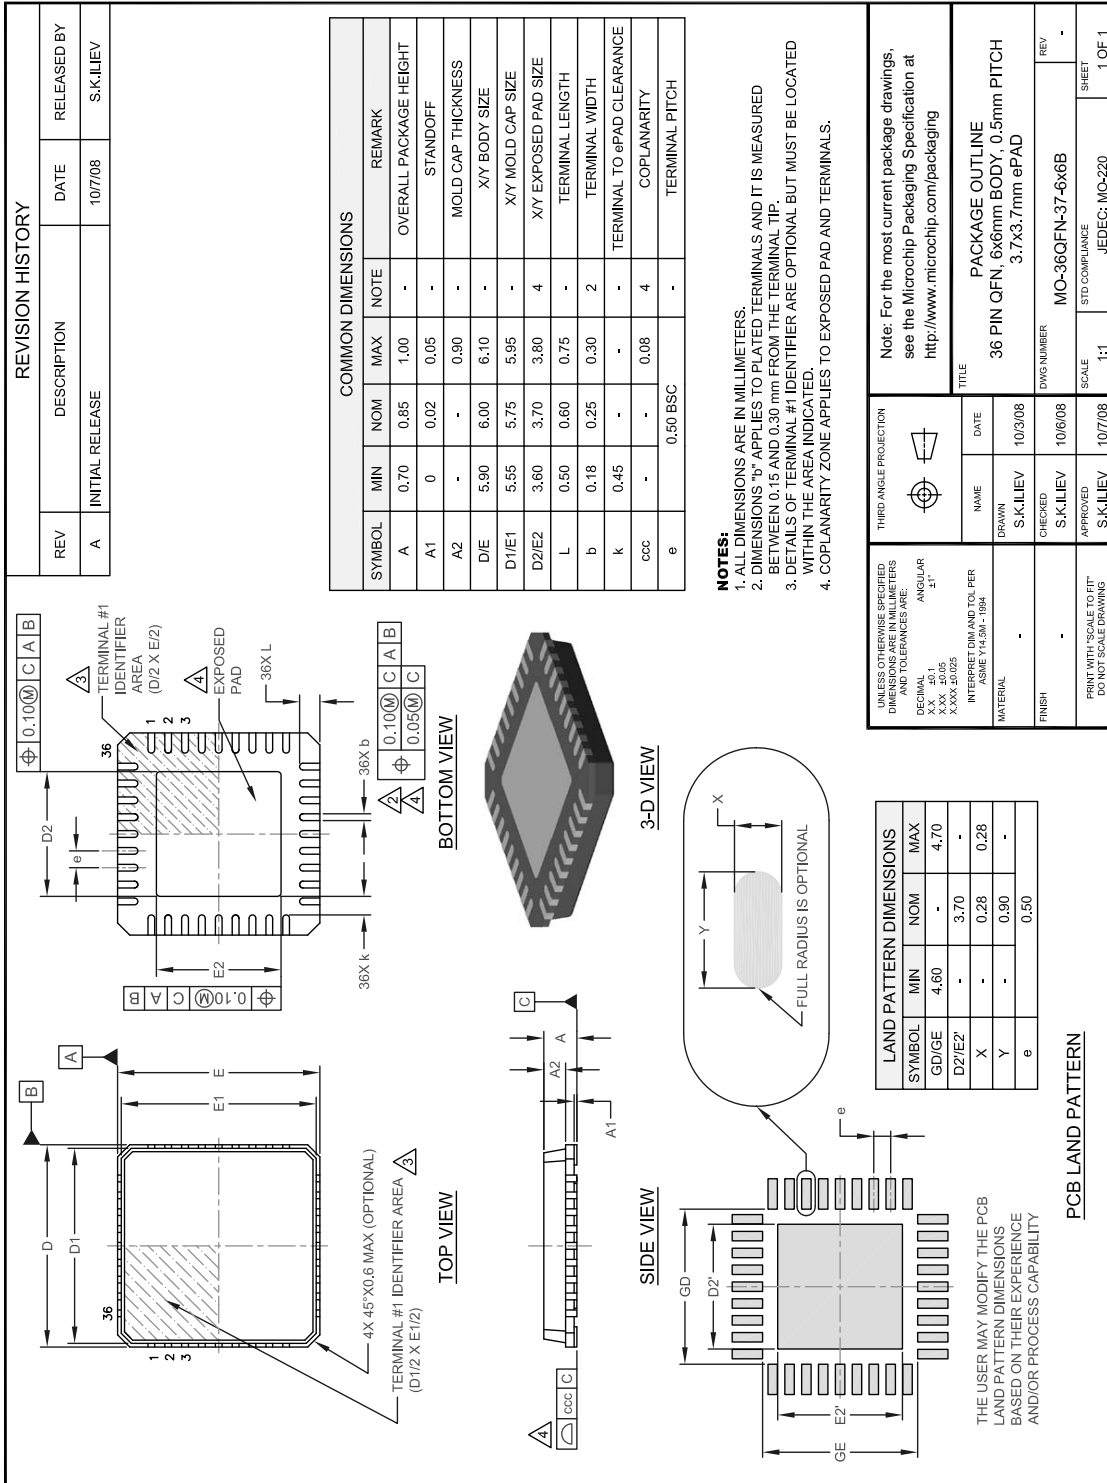

FIGURE 9-2: 48-PIN TQFP PACKAGE OUTLINE (7X7X1.4MM BODY, 2MM FOOTPRINT)

USB2502

APPENDIX A: DATA SHEET REVISION HISTORY

TABLE A-1: REVISION HISTORY

Revision	Section/Figure/Entry	Correction
DS000002248A (07-29-16)	Replaces previous SMSC version Rev. 2.3 (08-27-07).	

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://www.microchip.com/support>

USB2502

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

<u>PART NO.</u>	-	<u>XXX</u>	-	<u>[X]</u>
Device		Package		Tape and Reel Option
Device:		USB2502		
Package:	HT	= 48-Pin TQFP		
	AEZG	= 36-Pin QFN		
Tape and Reel Option:	Blank	= Tray packaging		
	TR	= Tape and Reel (1)		

Examples:

- a) USB2502-AEZG = 36-Pin QFN
RoHS Compliant Package, Tray
- b) USB2502-AEZG-TR = 36-Pin QFN
RoHS Compliant Package, Tape & Reel
- c) USB2502-HT = 48-Pin TQFP
RoHS Compliant Package, Tray

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. Check with your Microchip Sales Office for package availability with the Tape and Reel option. Reel size is 3,000.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Trademarks

The Microchip name and logo, the Microchip logo, AnyRate, dsPIC, FlashFlex, flexPWR, Heldo, JukeBlox, KeeLoq, KeeLoq logo, Klear, LANCheck, LINK MD, MediaLB, MOST, MOST logo, MPLAB, OptoLyzer, PIC, PICSTART, PIC32 logo, RightTouch, SpyNIC, SST, SST Logo, SuperFlash and UNI/O are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

ClockWorks, The Embedded Control Solutions Company, ETHERSYNCH, Hyper Speed Control, HyperLight Load, IntelliMOS, mTouch, Precision Edge, and QUIET-WIRE are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, BodyCom, chipKIT, chipKIT logo, CodeGuard, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, EtherGREEN, In-Circuit Serial Programming, ICSP, Inter-Chip Connectivity, JitterBlocker, KlearNet, KlearNet logo, MiWi, motorBench, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PureSilicon, RightTouch logo, REAL ICE, Ripple Blocker, Serial Quad I/O, SQI, SuperSwitcher, SuperSwitcher II, Total Endurance, TSHARC, USBCheck, VariSense, ViewSpan, WiperLock, Wireless DNA, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

Silicon Storage Technology is a registered trademark of Microchip Technology Inc. in other countries.

GestIC is a registered trademarks of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.

All other trademarks mentioned herein are property of their respective companies.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
== ISO/TS 16949 ==

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELoq® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
